

Regional & Product Commercial Policy

Internal analytical reference — synthetic policy created for the AI Analyst project

Purpose

- This document introduces realistic business constraints that the agent can compare against observed SQL results. It is intentionally synthetic and is not a real company policy.
- The database remains the numerical source of truth. This document supplies business context and review conditions, not replacement data.

Regional product review rules

- Germany: Tables and Bookcases are commercially sensitive categories. Orders with discounts above 20% should be reviewed for promotional or negotiated-pricing justification.
- France: Machines are subject to enhanced margin review. Discounts above 20% should be treated as an exception requiring explanation.
- USA: Tables with discounts above 20% should be reviewed because the category has shown loss-making behavior in historical analysis.
- Italy: Low-volume product/category combinations should not be treated as representative of the broader market without checking sample size.

How the agent should use this

- If a product/category-country combination breaches a review condition, identify the affected orders, customers, sales, profit and discount exposure before drawing a conclusion.
- A policy exception is possible. The agent should look for evidence of an approved promotion, negotiated account pricing, or other documented exception if such information is available.
- A policy breach is an investigation trigger, not proof that the policy caused the financial outcome.

Observed-data rationale

- In the supplied data, France Machines, Germany Tables, Germany Bookcases, and USA Tables contain negative aggregate profit. These patterns motivated the synthetic review rules above.
- The data also shows high discounts in several loss-making subcategories, particularly Tables, Machines and Bookcases. This supports using discount exceptions as investigation triggers.
